This written publication is wonderful. It can be written in straightforward phrases instead of confusing. I discovered this pdf from my dad and I suggested this publication to learn.

Since the formulae expressed in terms of the leads of the crossings are the same in each case, the proof holds good when the main line is curved. Hence the heels of the switches will be at the same distance from the springing, if $cr = cm = \sqrt{cr^2 - cr^8} / 2$ or if $cr = \sqrt{2} \cdot cr$; $S = 1$ and consequently $2Cm - Cr = \sqrt{2}$ When these relations do not hold, the interval between the heels of the switches is equal in one case to i Formulas are given for every case that can occur in Division I. in terms of the radii of the curves, and in terms of the circular measures of the crossings in Division II. The two simplest cases are those in which the heels of the switches of both branch roads are at the same distance from the springing. This three-throw possesses the following properties, whether the main line be straight or curved. a. Branch Roads Curving in opposite directions. (1) The circular measures of the angles of the crossings of the main-line rails are equal to each other, and are equidistant from the springing and the heels of the switches. (2) The circular measure of the angle of the crossing of the branch-road rails is equal to that of the angle of either main-line crossing multiplied by $\sqrt{2}$; and the distance of this crossing from the heels of the switches is equal to $v \cdot Ti - r^2 c$ (3) The point of...
